

en programacion de python by Alex Rubio and Hyrum Whetten

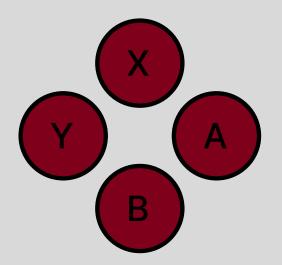

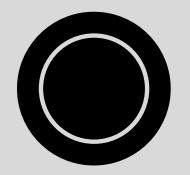

## Def:

The continue function is where you can skip a loop without using break. You can use an if statement to test if a condition is true and continue the loop.

## EHAMPLE:

```
i = 5
while i < 5:
    if i == 4:
        continue
    print(i)
    i += 1</pre>
```

(result)1235

Steps to use continue in PythonDefine a loop: --It can be a for loop or a while loop.

-Set a condition: Use a logical condition to determine when you want to skip the rest of the code.
-Place continue inside the loop block: When the

condition is met, the loop will skip the rest of the code in that iteration and move to the next one.
